PROFESSIONAL SUMMARY

UNBC Computer Science student with hands-on experience shipping full-stack and ML-powered features across Angular/React, Node.js, Python, and SQL, from API design to cloud deployment. Built end-to-end web applications, credit card fraud detection models, and sensor-driven HRI coaching systems that deliver real-time feedback and measurable improvements in user outcomes. Comfortable owning features in modern web stacks, integrating third-party APIs and relational databases, and collaborating asynchronously in remote/hybrid teams with clear documentation, code reviews, and automated checks.

EDUCATION

University of Northern British Columbia • GPA 3.90

Jan. 2023 – Present

B.Sc. Computer Science, Minor in Management Information Systems

Prince George, BC

- Key courses: Data Structures, Database Systems, Software Engineering, System Design

EXPERIENCE

AI & Data Science Intern | Aga Khan University, Global Health

Jun. 2025 – Present

Central Africa & Central Asia (Remote / Hybrid)

- Designed and deployed a Python-based conversational voice agent (**LiveKit, Gemini**) for native-language frontline health worker support, plus **runbooks** that let non-technical staff operate it autonomously.
- Engineered and evaluated dengue-case forecasting models using epidemiological and climate data, reaching **85–90% accuracy** on multi-year held-out data to support planning for outbreak response.
- Optimized the voice agent's flows and prompts for **low-bandwidth**, rural use cases, enabling 24/7 native-language symptom triage.

Research Assistant, Robotics Lab | University of Northern British Columbia

Jan. 2025 – Present

Prince George, BC

- Configured **ROS 2, Linux, and Python** stack for **QTrobot** HRI exercise coaching, integrating multi-sensor inputs to track form and repetitions with **98% session** interaction logging.
- Developed cross-platform exercise routines so the robot could give real-time feedback and encouragement, increasing participant completion rates by **approx. 30%** in pilot testing.
- Instrumented adherence and error metrics tracking and packaged the system with reproducible scripts, cutting researcher **onboarding time by 40%** and de-risking future experiments.

PROJECTS

Jobtrackr | *Angular, Node.js, Express.js, PostgreSQL, AWS, Gemini API* | [GitHub](#)

Sep. 2025 – Dec. 2025

- Built and iterated on a full-stack platform that replaces spreadsheet job tracking with a centralized dashboard, slashing manual updates by **60%** and improving follow-up completion for users.
- Integrated Gemini APIs to auto-compare resumes vs job descriptions, raising keyword match scores by **35%** and shrinking manual review time from **15 to under 3 minutes**.
- Shipped an AI-powered cover letter generator that produces tailored, keyword-optimized letters in less than **30 seconds**, increasing application submission rates **2–3x** while preserving consistent formatting.

Credit Card Fraud Detection | *scikit-learn, TensorFlow/Keras, SMOTE* | [GitHub](#)

Sep. 2025 – Dec. 2025

- Built an end-to-end fraud detection pipeline for **284K+ highly imbalanced transactions (0.2% fraud)**, using preprocessing, SMOTE, and scikit-learn/TensorFlow models to balance recall with acceptable false positives.
- Compared four models (**Logistic Regression vs MLP, ±SMOTE**) and tuned thresholds to reach **F1 0.79** on the MLP baseline, detecting 81 fraud cases with minimal impact on legitimate transactions.
- Summarized model behavior via confusion matrices and simple decision guidelines that let non-ML stakeholders understand **risk/benefit tradeoffs**.

TECHNICAL SKILLS

Programming & Scripting: Python, Java, JavaScript, TypeScript, Ruby (learning), SQL, C, Bash, PowerShell

Web, Backend & Systems: Node.js, React, Angular, Express.js, REST APIs, GraphQL (learning), System Design, Event-Driven Architecture

Cloud, DevOps & Tools: Azure, AWS (deployment), CI/CD pipelines (GitHub Actions), Integration Testing, Monitoring & Logging, GitHub, JIRA
